ANVESHAK · ಅನ್ವೇಷಕ

An AI that doesn't just answer questions — it works cases.

Team Zen — Hiran Vikraman S R · Arun G K | Challenge 1

Live: <https://anveshak-api-50044329134.development.catalystappsail.in/ui/>

One night in Jayanagar

A woman's gold chain is snatched by two men on a motorcycle. The FIR is filed at Jayanagar station.

- The same men struck in Mandya last month, and Tumakuru before that.
- Nobody knows. The records sit in three district silos, and no one has time to read 15,000 narratives looking for a pattern.
- To even ask 'how many chain snatchings this year?', an officer needs someone who writes SQL — and English.

This is the gap ANVESHAK closes.

Ask. Then let it work the case.

- **Ask in Kannada or English** — voice or text, and every answer arrives with its SQL, its rows and its case IDs.
- **Find the ring** — MO fingerprinting links crimes across district boundaries that siloed records never connect.
- **Work the case** — six specialist agents assemble a court-ready Investigation Pack in about ten seconds.
- **Patrol tonight** — an overnight sweep raises ranked leads and turns them into a deployment plan.
- **Prove it** — role-scoped access, a tamper-evident audit log, and guardrails you are welcome to attack.

Live demo

From the FIR a constable files, to the pack an IO takes to court.

- The overnight sweep — and the morning briefing, in Kannada
- A question, answered with its evidence
- Try to break it: injection, exfiltration, profiling
- File a new FIR — in your own words — and watch it join the series
- Replay the ring crossing three districts
- Six agents work the case → the pack → the suspect
- Tonight's patrol plan · the same question as SHO, and as Analyst

What it would have changed

SH-07 · Operation Gold Chain Black Visor

ANVESHAK flags this ring at case #6, on 10 February 2026.

Nine further chain snatchings across Bengaluru City, Mandya and Tumakuru followed over the next **142 days** — after the pattern was already visible.

Computed by replaying our own linkage engine over the corpus truncated at each of the series' case dates. A retrospective replay on synthetic data — not a prediction, and not a claim about a real case.

Built to be checked, not believed

- **The model never computes a number** — deterministic tools do; the model only narrates. Every figure traces to a tool result and a case ID.
- **Attack it yourself** — a red-team console in the product. 10 of 10 attack vectors blocked, re-tested on every page load.
- **Religion and caste are never model features** — a profiling question is refused, in English and Kannada, and the refusal is logged.
- **Scope is enforced in the query** — SHO sees a station, SP a district, Analyst sees masked names. Not hidden in the browser.
- **History cannot be rewritten** — the audit log is hash-chained; press 'Verify chain' and watch it recompute.
- **Our ground truth is public** — linkage precision 0.86, recall 12/14, checkable against the planted data in the repository.

Runs entirely on Zoho Catalyst

Officer (EN/KN, voice or text) → React SPA → FastAPI on AppSail

intent router → NL→SQL (guardrails · ADR-9 policy · role scope · self-repair)

→ typed tools: linkage · graph · forecast · hotspots · risk · similar

DuckDB analytical mirror ↔ Catalyst Data Store (system of record)

Catalyst QuickML → GLM-4.7-Flash · SmartBrowz → pack PDF

Cron → Night Patrol → lead cards → morning briefing

No external inference API is ever called from the deployed app.

What we would build next

- CCTNS integration: live read connection + identity resolution on name / parentage / DOB, replacing our synthetic person key.
- Catalyst Auth issuing real officer identities into the scope layer that already enforces them.
- Kannada NL→SQL tuning with hand-curated examples from real officer phrasing — our clearest measured gap.
- Human-in-the-loop learning: every Confirm/Reject on a series becomes a label that improves precision.
- A pilot with one district's live data — that is the ask.
